

**DopaGE is a health education company on a mission to measurably reduce death and suffering related to substance use among college students.**

Our cloud-based learning platform is easy for academic institutions to implement, and our content is designed by neuroscientists, emergency medical personnel, and UX researchers to keep students engaged toward retaining life-saving educational material.

DopaGE students feel like they are watching cartoons and playing video games, all the while engaging with educational material based on peer-reviewed illicit drug publications and emergency medical practices. In our case study on hundreds of college students, **95% reported that they enjoyed our content more than any other substance education they have ever received** and averaged near perfect scores on the accompanying assessment.

Not only can we deliver life-saving results, but we can save academic institutions millions of dollars by avoiding wrongful death lawsuits resulting from preventable student overdose deaths and reducing accident insurance costs.

DopaGE modules in our basic version cover Cocaine, MDMA, Xanax, and Opioid Overdose Response so that every student on campus is equipped with life-saving knowledge to prevent overdose fatalities.

If you are interested in providing your students with standardized overdose prevention education through DopaGE, please email [hello@dopa.ge](mailto:hello@dopa.ge) to set up an introductory call! We would love to support your administration in keeping every student on your campus safe, happy, and healthy.
